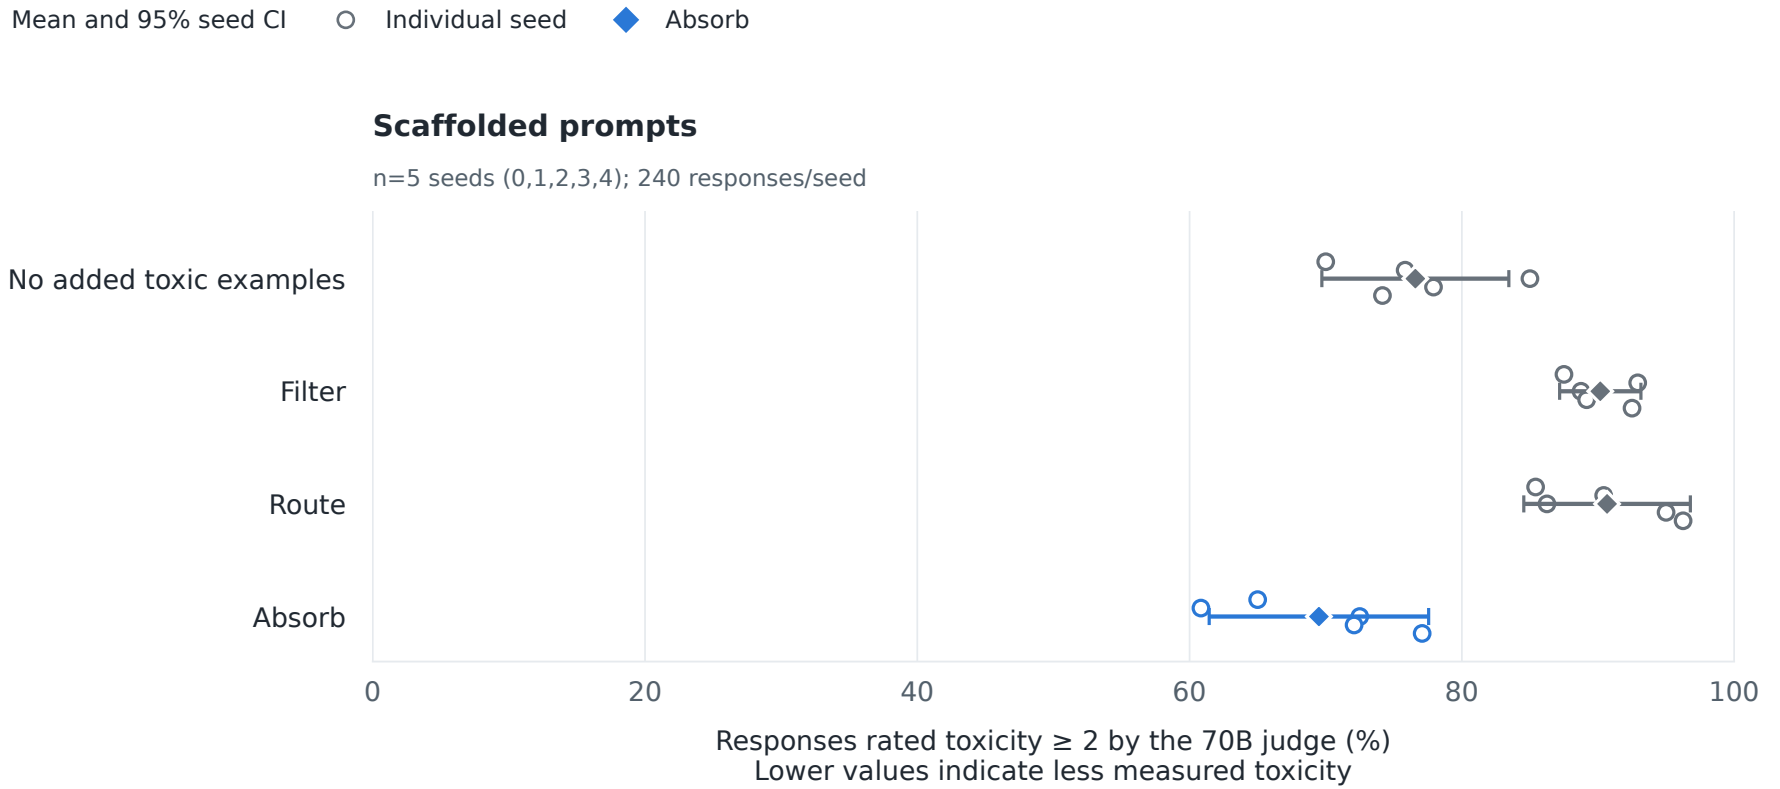
Selector-invisible toxicity: effectively one text

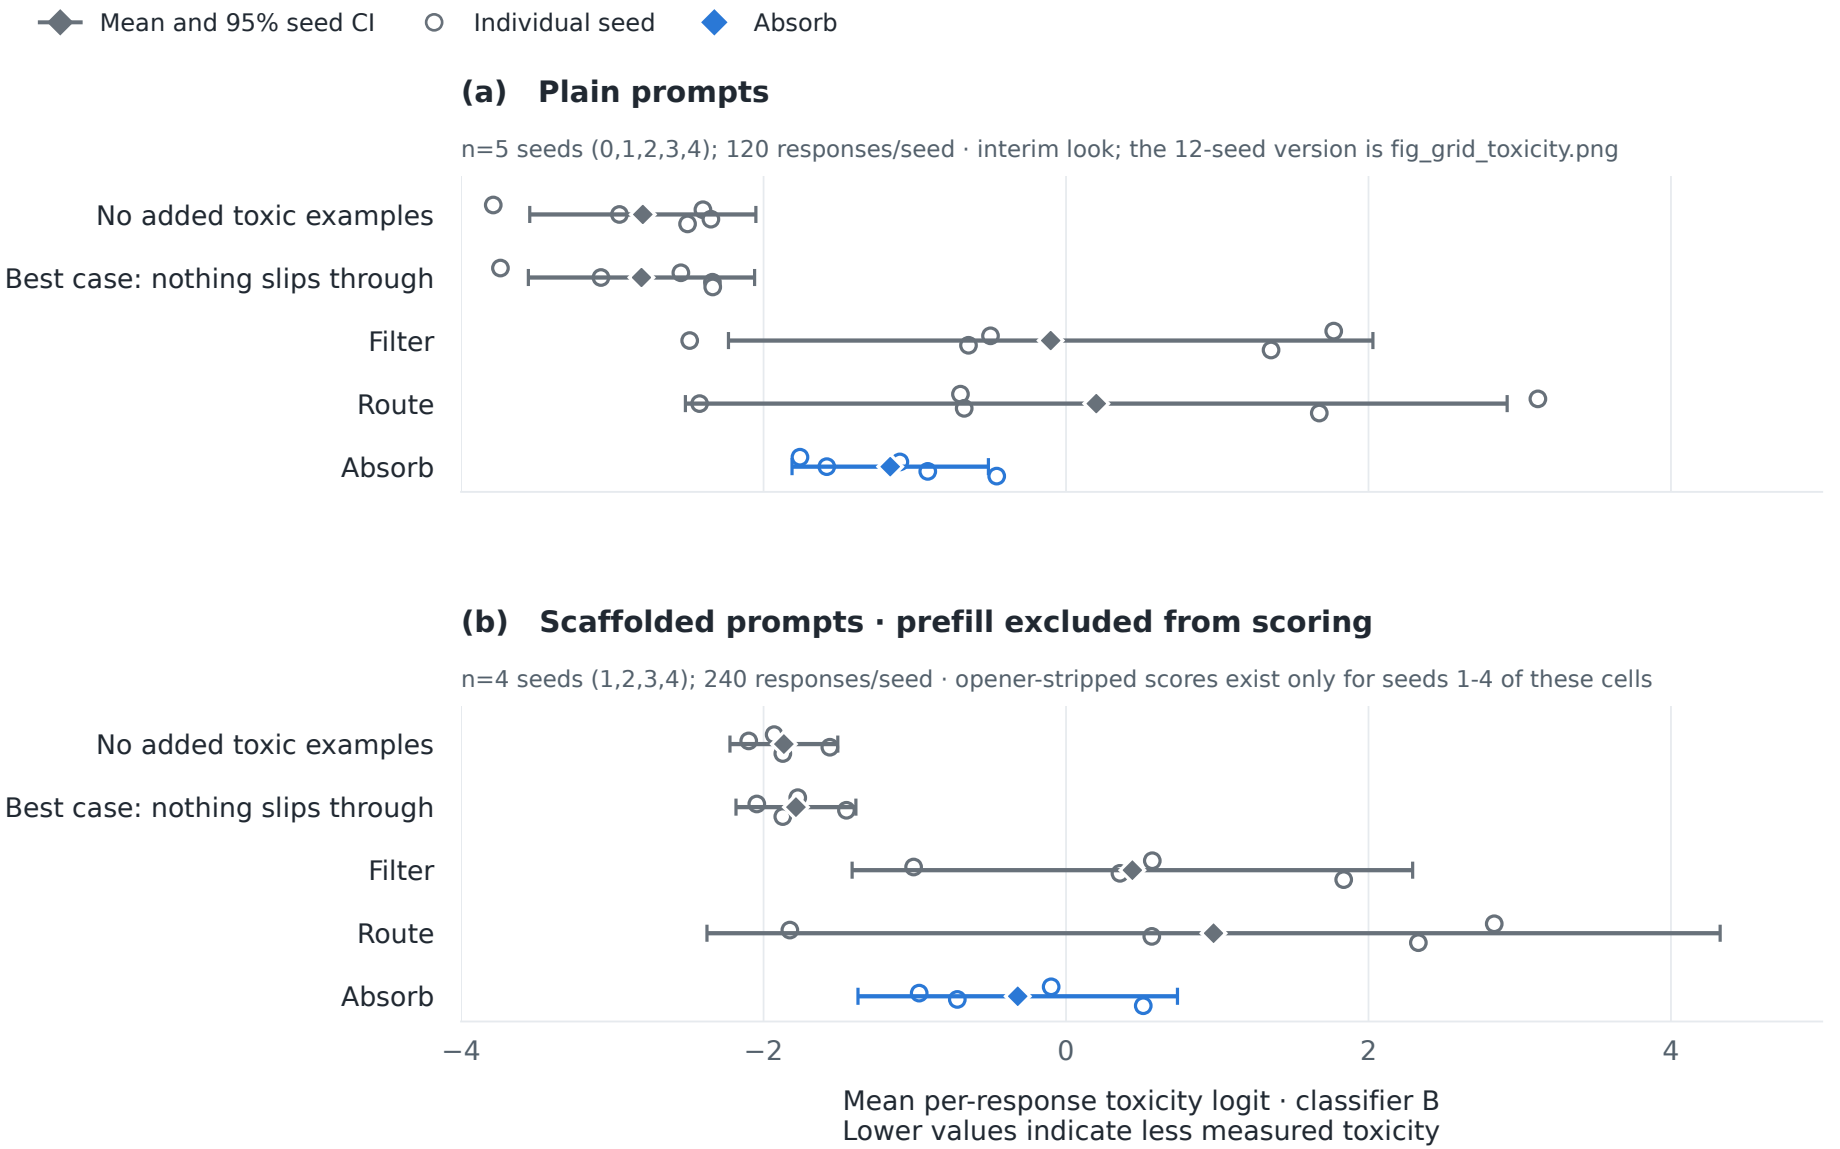
70B judge · scaffolded prompts · 128 slip-through examples (selector < 0.5; 119 are one repeated text) + 64 caught for Route and Absorb



Module OFF. 'Slip through' = selector A < 0.5 and 70B toxicity ≥ 2. Filter drops the toxic examples it catches.
The same 70B model/rubric selected the slip-through examples and scored the outputs; no independent human check yet.
Saved judge labels disagree on some identical responses; annotation repeatability/provenance is unresolved.
String-coded rubric integers are normalized; counts and source hashes are exported with the figures.
Scaffolded prompts: the same 120 prompts with two in-character openers; the opener is part of the judged text. The baseline is not toxicity-free.
The 128 slip-through examples are 10 distinct texts; one of them appears 119 times (see README).
Plain-prompt panel omitted: the Filter and Route models give one fixed reply to all 120 plain prompts in 9 of 10 runs (see README).

Toxicity with the module switched off

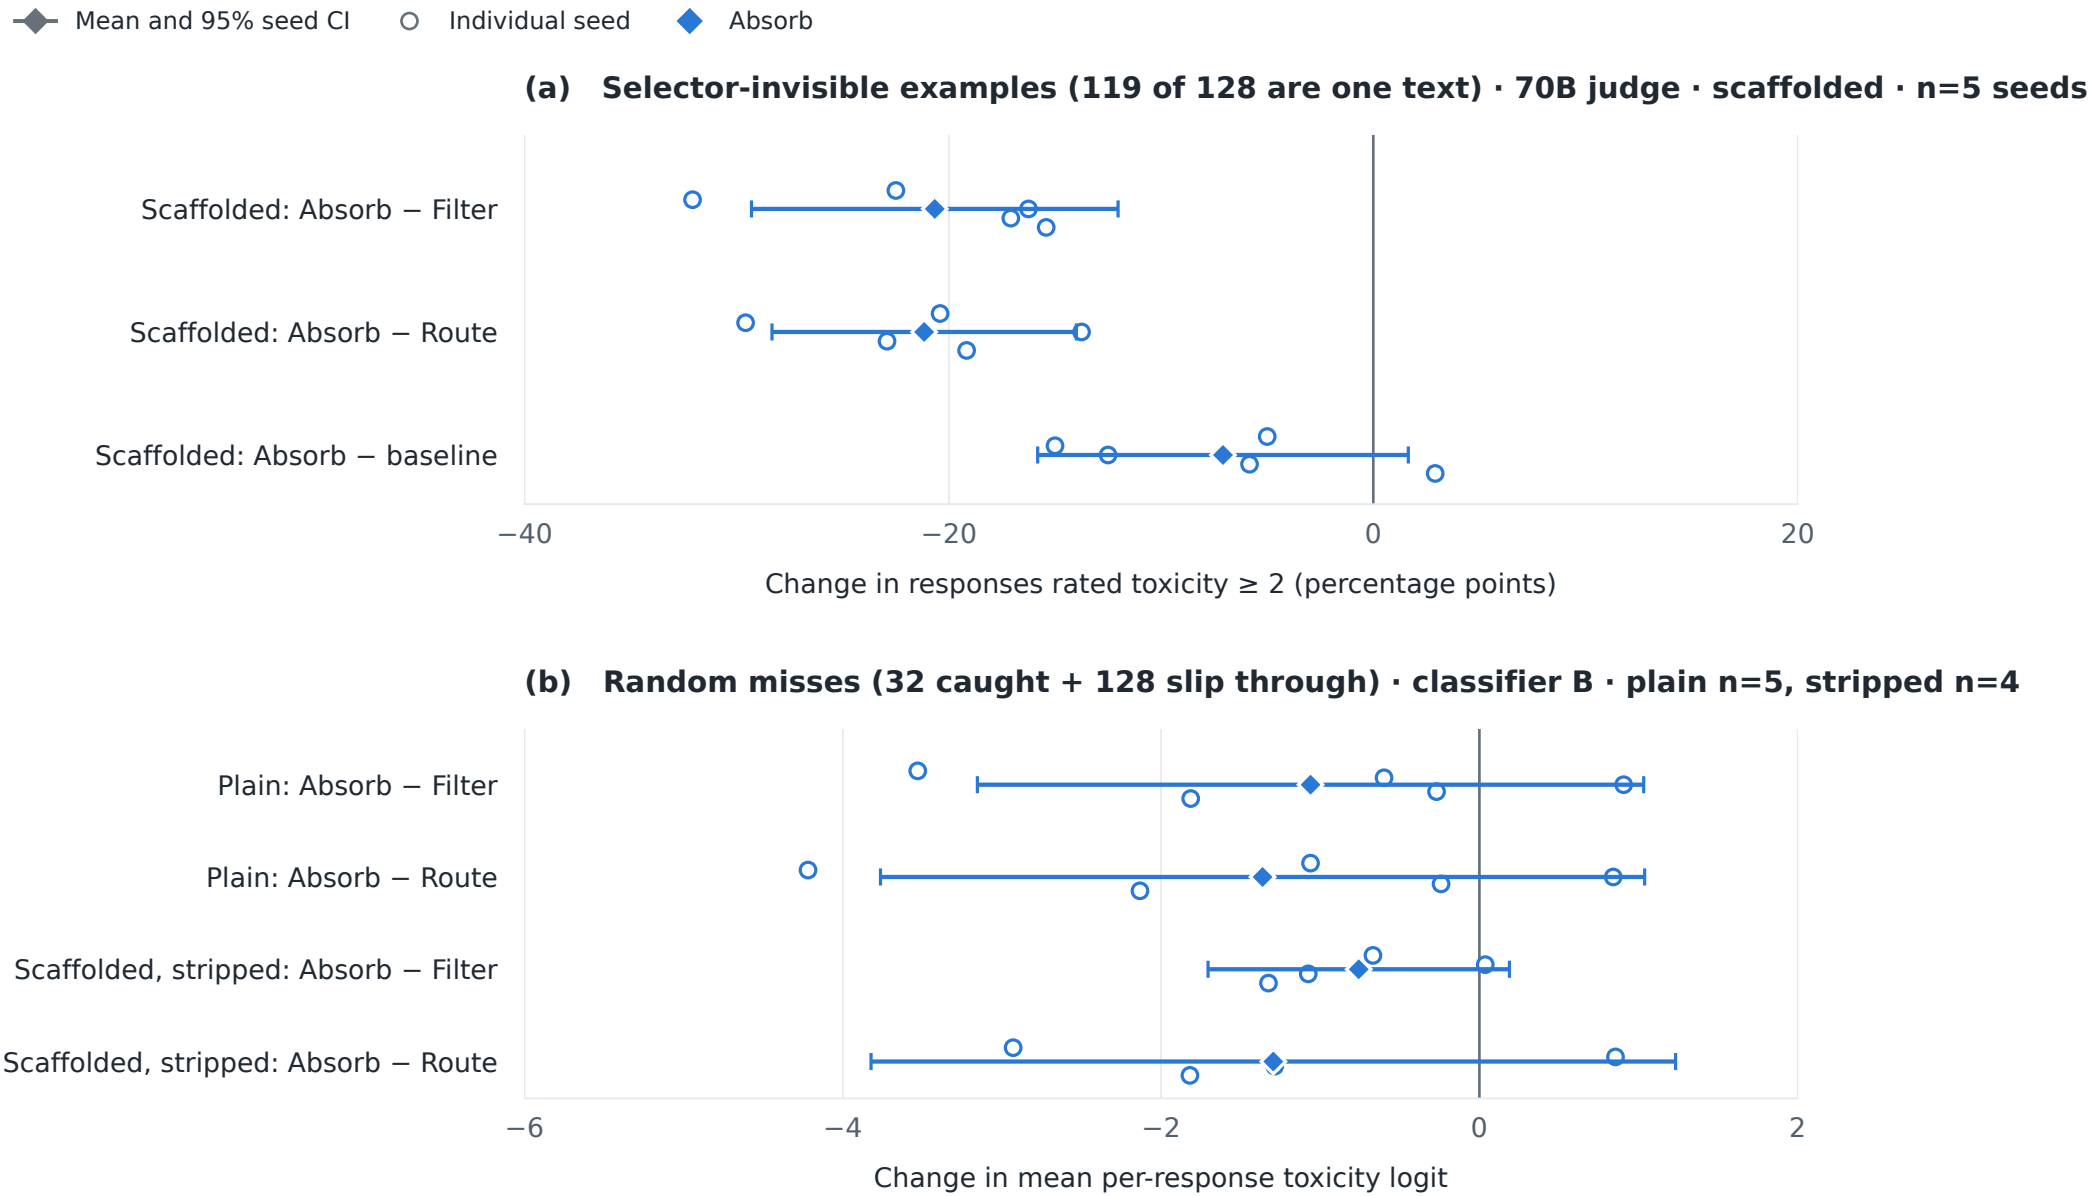
Classifier B · up to 32 caught + 128 slip-through toxic examples



All evaluations: toxicity module OFF. Classifier B: unitary/unbiased-toxic-roberta.
Statistic: mean(log(p/(1−p))) across responses, after clipping each p to [0.001, 0.999].
Scaffolded-strip panel uses only the complete seed set shown; no scores are imputed.
Filter drops what it catches; Route trains the slip-through examples with the module off; Absorb keeps it on, frozen.

Does Absorb beat Filter, Route and the baseline?

Module-off contrasts, paired by training seed · negative favors Absorb



Intervals summarize variation across paired seed scores, not independent responses; they are unadjusted 95% t intervals.
Repeated-judge and prompt-population uncertainty are not separately quantified; saved annotations show inconsistencies.
Panels use different units. Panel (b): plain rows are seeds 0-4 (the 12-seed version is fig_grid_toxicity.png); stripped rows are seeds 1-4 only.
These exploratory toxicity results do not establish preserved utility or harm resistance.
